Insight + Inspiration Series

Creative Uses of Off-Camera Flash

VOLUME 1

The Insight + Inspiration Series from Tether Tools kicks off with our Creative Uses of Off-Camera Flash guide, featuring eight articles on lighting from master portrait and wedding photographers. Go behind-thescenes in a New York City stairwell for a portrait shoot with a ballerina, out to Joshua Tree National Park for an engagement photo session, in a dark alley for a fire whip themed shoot, and much more.

Lighting a Wedding Venue Without Stands

by Jared Platt

MULTIPLE LIGHTS, IN MULTIPLE PLACES CREATE MORE VOLUME AND MORE DRAMA IN YOUR SHOTS

When you walk into any reception, you need to quickly assess the situation, and make a decision on HOW you are going to light it, and then set up your gear. It can be fast-paced at that moment, and there is no greater photography fear than walking into a reception hall and not being sure if you can capture the moments the way you envision them.

In this video, photographer Jared Platt toured a wedding reception hall and shows in this video how to light the entire venue using no lightstands. "The problem with stands in a venue is they create trip hazards and they clutter up an already beautiful space," says Jared.

In the first scenario, Jared has mounted a speedlight to the thick curtain at the reception to create fill light in that side of the room using the RapidMount EasyGrip. Next, Jared uses the innovative RapidMount SLX to mount two speedlights to windows to backlight head table and room.

If you have a flat, vertical surface, you have a place to mount your speedlight. The RapidMount SLX mounts directly to any smooth, lightly textured or painted surface such as drywall, veneer, glass, mirror, laminate, fiberglass, metal, tile, porcelain and marble using the included specially-formulated, pressure-activated RapidStrips, which remove without damage, or leaving any residue.

Opposite the first flash, Jared again cross-lights the room by mounting a speedlight to a wall mount using the RapidMount SuperFlex Arm. Next, Jared uses the RapidMount MaxClamp to mount a Profoto B2 to the edge of a door frame to light the entire room.

GEAR LIST:

- Cross-light a room with the RapidMount EasyGrip
- Backlit room with two RapidMount SLX
- GoPro mounted with RapidMount PowrGrip
- Setup a microphone using the RapidMount Q20
- Cross-light a room with the RapidMount SuperFlex Arm
- Mount iPhone with RapidMount Q20 and Rock Solid LoPro Phone Mount
- Mount a light with RapidMount MaxClamp
- Slide show at bar on an iPad with AeroTab Universal Tablet System and Rock Solid SuperFlex Arm

Mounting Speedlights on Location

by Daniel Norton

I'm super excited to show the images Seth Miranda and I produced on this collaborative shoot. We had a very challenging location that we knew could be used to create some magic and just needed the right model, concept and gear to make it happen.

As a photographer out on location, bringing lightstands isn't an always an option. Space, power, and other factors can lead to those bulky stands from leaving the studio.

Tether Tools.

Solid Master Clamp.

Thankfully, there's other ways to bring light to your shoot while out in the world. In this video we created beautiful, studio quality portraits with model Natalie Scarlett using battery operated speedlights and grip gear from

We took to the stairwell/chimney of my studio, in a precarious place where lightstands simply wouldn't work as the area couldn't be blocked with stands. In the video, you'll see that we mount a keylight with softbox to a pipe using the Tether Tools Rock Solid Master Articulating Arm and Rock

Then, a second speedlight with gel behind the model to help add dimension to the image using the smaller RapidMount EasyGrip Kit.

Greek Inspired Portrait Shot

by Jeff Carpenter of Ready Light Media

WATCH THE VIDEO 🚺

The concept of this shoot was to bring the streets of Santorini Greece into the studio. I wanted a vibrant outdoor feel for a fashion shoot, but unfortunately shooting on location wasn't an option. With just a few simple props and an extremely simple lighting setup, we were able to achieve the look we were going for without traveling halfway across the world.

The setup for this shot was extremely simple. I wanted the final image to look as natural as possible, so, I decided to just use one light to mimic the sun. I chose to use a single Paul C. Buff Einstein with a diffused silver beauty dish. This created a hard-light source that was still natural and beautiful. I placed my model in the corner of an L-Wall with a roll of blue seamless paper taped to one side to add some color to the scene.

I almost always shoot tethered whether I'm on location or in the studio. I like having everyone on set be able to view the images in real time and give their feedback. That way the shoot can go as smooth as possible and no time is wasted. I also like not having to transfer the images from a card to my computer. It may seem silly, but it saves me a lot of time in the long run.

a single shot.

Photo: Adam Sanner

The biggest challenge I ran into during this shoot was keeping the energy level up on set. I wanted to be able to shoot rapidly and have my model move around, but with the look, I was going for, my strobe was almost at full power which made for a longer recycle time. I didn't want to wait for the strobe to fire again, so I bumped my ISO up to 800 and lowered the power of my strobe which allowed me to shoot fast without missing

For this shot, I just did some basic skin retouching and slight levels adjustment in capture one. Nothing crazy, but I wanted the final image to look as natural as possible.

I had pretty minimal gear for this shot. Other than the L-Wall prop, and my actual lighting, there wasn't much other gear. I shot with a Tamron 70-200 f/2.8 lens because I wanted to be able to shoot a variety of looks and that lens is extremely versatile in my opinion. I was using a 15' TetherPro USB cable with a 15' USB extension to give me some additional room to move around while I shot.

In the spirit of keeping things simple, I had a pretty bare bones crew as well. My model styled and did her own makeup, and I just had one photo assistant. Sometimes I find that working with a small crew helps the shoot go faster and smoother.

Fire Whip

by Robert Trawick

THE SLOW SHUTTER SPEED EXPOSED THE FLAMING WHIP WITH THE FINAL FLASH FREEZING THE MODEL

The concept was to capture fire and movement in a dramatic portrait. I've always been fascinated by circus performers and see them as superheroes of public entertainment. The idea of a "femme fatale" ringmaster with a flaming whip wasn't that far from my previous shoots with the "Wall of Fire".

This was the very first time I've tried using a 6' bullwhip - on fire - in a shoot. Besides the unknown of how the leather would absorb and burn, I was concerned the speed of the whip would blow out the flame. Another technical challenge would be finding a balance between ambient exposure for the background with burning whip and a single flash pop to freeze the model. Amazingly enough, after practicing our timing, the first shot was one of the best images of the 30 odd frames exposed. We could have shot longer but the fire burned thru the inner cord of the whip. We only purchased two props for the shoot.

The setup was a simple cross light pattern to deliver enough power to light the model, freeze the moment but not overpower the dark alley. The Interfit Photographic S1 with XP PhotoGear A100 Speedbox was placed on camera left aiming slightly in front of the model. The front diffusion panel was removed to use the more specular silver finish - inside the modifier - to bring out the velvet texture of the ringmaster coat.

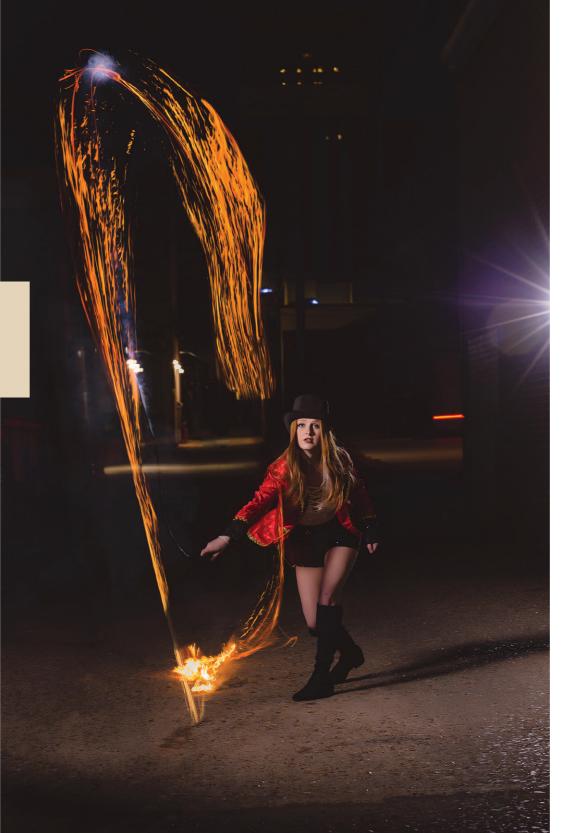

A small flash, Interfit TLi-N was mounted on flat metal downspout diagonal from the main light. Using the Rapid-Mount SLX for the flash was crucial to

proper placement without using an extra light stand and removing it in post-processing. This cross backlight helped add separation of the model and her outfit from the much darker background.

After the light was set, we practiced the timing of the whip movement and settled with a shutter speed of one second. The aperture of f8 cut the available light down enough to keep bleeding to a minimum during the movement of the model. The flash was set to rear curtain sync and would flash to freeze the model at the end of the exposure. We gave a countdown and on 3, the model began the whip swing as I clicked the shutter to start the process. The slow shutter speed exposed the flaming whip, distant background lights and some movement of the model with the final flash freezing her in a forward aggressive pose at the end of the swing.

Shooting with the Case Air was key to having a larger monitor, in this case, the Apple iPad, to review the shots to make small tweaks and zoom in easily to judge the balance between the ambient and flash exposures. Using a tethered system helps the photographer, talent, and crew stay on the same page of the concept. When shooting with a commercial client, I find that the sessions are more productive and shoot less since content, focus and exposure are more accurately visible with a larger screen.

One note on using the iPad with tethering on site. I've used just about every online iPad holder and nothing is as sturdy, reliable and safe as the AeroTab. Don't

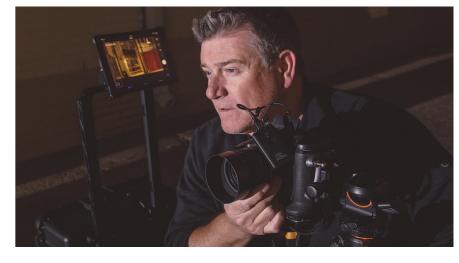

Robert has been called "the most interesting photographer in Oklahoma", and loves sharing the knowledge, tricks and passion for the craft honed over a 30+ year career. A self-professed 'time-traveler', Robert has been active in the industry since 1980 and received much of his formal training during a twenty-year career as an USAF photojournalist.

✤ trawickimages.com instagram.com/trawickimages gear.

The images were imported into Lightroom, culled and edited using DVLOP tone curves. I used a curve and preset with low contrast blacks for a nice filmlike look but still kept the vibrant warm tones. Using PhotoShop, I layered two of the best images and blended the flames on the whip to increase the fire and visible travel trail. I also used the dodge tool for brightening the fire.

We have a great relationship with Vail Model Management so one phone call to Eric Epperly and we got Macy onboard

GEAR LIST:

- Interfit Photographic TLi-N Flash

THE TEAM

- Robert Trawick: photographer & coffee drinker

- John Doe: bicyclist removed in post processing

get suckered into inferior products that will jeopardize your \$800 iPad. You will save so much more than money when you invest in the best solution for your

for the shoot. While the idea had been percolating in my brain for a few weeks, this shoot was worked out in about 24 hours. The fact our talent was a redhead, fit the ringmaster outfit perfectly and wasn't afraid to play with a whip on fire was a bonus. I guess it's hard to be stealthy shooting in a popular area, even if it's a dark alley in Oklahoma City and we were spotted by another photographer Christian finishing his shoot. He was wonderful in volunteering a hand with some BTS video. Special thanks to my wife Terri for being the fire master with soaking, adjusting, lighting and extinguishing the props. Never shoot fire alone and always use someone you fully trust because the pretty dancing flames can get out of hand quickly. No one was injured on this shoot.

RapidMount PowrGrip Kit

by Sunshine & Reign Photography

IT'S NOT ALWAYS PRACTICAL AND NOT ALWAYS BEST PRACTICE TO THROW UP A STAND WHEN PEOPLE ARE DANCING AND CHILDREN ARE RUNNING ABOUT

Despite being prime lens, off-camera flash wedding photographers, we try not to be gear heavy, and we don't like complicated. Tether Tools is right there with us in the respect that their RapidMounts make things easier. The designs and quality are legit; the myriad of options is impressive, and there's really a mount for every budget.

One of the more extraordinary products we've found is the RapidMount Powr-Grip Kit and in this article we demonstrate how we used it across the course of several weddings. From capturing our clients getting ready to lighting receptions, the PowrGrip allowed us to get the light where we needed it, despite challenging environments and situations. The RapidMount PowrGrip Kit (\$67.90) mounts speedlight flashes securely to any non-porous surface. It's particularly useful for glass surfaces like windows and mirrors, but we also stuck it to a DJ's speakers when we needed to mount a light in a specific location in order to safely get the shot we wanted at a reception. Its uses are pretty endless, depending upon your own creativity and needs.

The PowrGrip isn't just a suction cup, though, because while a standard suction cup presses against a surface and then creates a seal by pulling away from the surface, the PowrGrip has a vacuum cup that uses a spring-balanced, hand-actuated pump to efficiently remove air from between the rubber pad and the attaching surface. Thus, it creates a longer-lasting hold; it's the same tech used for transporting large pieces of glass and mirrors. And the PowrGrip is enhanced with a red-line indicator that warns if there is a drop in its holding power. That's smart.

The PowrGrip has a $\frac{1}{4}$ "-20 thread for mounting not just speedlights but cameras and a variety of other gear as well (tablets, e.g.). It supports weights up to 10lbs and includes the Tether Tools' Lifetime Warranty. It has a 4.5" diameter mounting pad, a removable bullhead assembly, comes in non-reflective black, and includes a pad protector (the red piece on the bottom).

WATCH THE VIDEO 🚺

How We Shot It: Getting Ready

Because our lighting assistant can't always stand on a dresser while also holding a "kicker light", and because we can't always cram a light stand into small places, we love to use a variety of mounting systems in our kit. On one occasion, we attached the PowrGrip to a mirror to help us out while chasing the infamous hairspray/perfume/mist image. We mounted the PowrGrip to a mirror, threw a MagMod MagGrid on our SB-910, and had at it. If you look closely, you'll see our lighting assistant crouched down behind our bride.

How We Shot It: The Gondola Lift

Very recently, we photographed a wedding in Telluride, Colorado. We knew we were going to have the opportunity to get in a gondola lift with our clients and wanted to create some memorable portraits inside the gondola lift itself. PowrGrip to the rescue, along with a bit of help from a MagMod MagGrid and A & M Film and Photo's Prism!

How We Shot It: Reception Lighting

One of our absolute favorite parts of a wedding is the reception because we love a party: the dancing, the joy, and all that celebrating well into the late night/early hours of the morning are right up our alley. And while our favorite option for securing our off-camera flash at a reception is our lighting assistant + a softbox (we prefer the Westcott Rapid Box - 26" Octa Softbox), it's not always practical and not always best practice to throw up a stand when people are dancing and children are running about. In the case of this reception, we got creative and used the PowrGrip to mount our light to one of the DJ's speakers.

Unlike a suction cup mount that is pressed onto a surface and then creates a seal by pulling away from the surface, PowrGrip vacuum cups use a hand-actuated pump to efficiently remove air from between the rubber pad and the attaching surface, creating a much more reliable, longer lasting hold.

Sunshine & Reign Photography (Amii and Andy Kauth) is based out of Phoenix, Arizona, and photographs weddings all over Arizona and the United States. We're modern and artistic. And we're certain of the fact that we're wedding photographers for the raddest of rad souls.

Joshua Tree Engagement Session

by WASIO Photography

THIS IS OUR FAVORITE SET UP ON LOCATION BECAUSE IT'S RELATIVELY LIGHT WHILE GIVING US 500WS OF LIGHT AND SUPPORT OF HIGH-SPEED SYNC

This shoot was an engagement session for our best friends - Camila & Chris. We met them a little over a year ago at the Creative Morning event here in San Diego and instantly became awesome friends. Camila & Chris have a social media marketing company and Camila is also a fashion blogger (@camilarpontes).

We are honored to photograph their wedding next year in Brazil and for their engagement session, we wanted to do something more special. We decided to go to Joshua Tree because Camila is a huge U₂ fan and obviously the Joshua Tree National Park has a special place in each U2 Fan's heart (because of one their most famous album Joshua Tree).

We planned to shoot for two days in the Joshua Tree National Park and the photos in this post are from the first day when we decided together to have a slightly more formal feel. Camila was wearing a beautiful red dress and Chris a nice blue suit. Camila also made her own bouquet out of silk and plastic flowers. Seriously, look at that bouquet and tell me it doesn't look 100% real! Camila did an amazing job creating it.

During the first day of the shoot, we wanted to show Camila's and Chris love toward each other, their modern chic feel and also their fun nature. Each of the four photos we selected has a slightly different feel to it and show Camila and Chris in a different way.

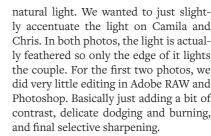

The first day when we photographed at the park we decided to go on the hike to the Barker Dam. It's not a long trail with only a couple of miles each way but we needed to travel light. My assistant and behind-the-scene video shooter was my wife Sasha who was also carrying our 3-month old daughter - Savannah! Check at the end of the video how this was handled!

So, because I had to carry everything, I decided to go very light - camera body (Canon 5D Mark IV), 3 lenses - Canon 24-70, 70-200 and Sigma 85mm f1.4 Art (big thanks to Hunt's for lending us this beautiful lens). For lighting, we used Phottix Indra 500 triggered with a Phottix Odin II for Canon. This is our favorite

set up on location because it's relatively light while giving us 500ws of light and support of High-Speed Sync. We also used one simple modifier - Phottix Luna II Folding Beauty Dish. We love this beauty dish modifier on location because it's super easy to assemble, with nice quality of light and removable deflector to get more power when needed.

Our first main challenge that day was the quickly changing and decreasing light as we were shooting till sunset. The second challenge, especially toward the end of the day was the strong wind that made it hard for Sasha to hold the light and also shoot some behind the scenes shots. The third challenge was the fact that we had to feed Savannah a few times during the session.

In the first two photos, we used the off-camera flash just to open up a bit the shadows without losing the beauty of natural light that afternoon. It was a bit cloudy so we had the nicely diffused

For the two sunset photos, we wanted a bit more dramatic feel. For that reason, we underexposed the ambient light and used the light on Camila and Chris so they stand out more against the gorgeous sunset sky. For the sunset photos, we did a bit more editing in Camera RAW to get the details out of the sky and the rocks to enhance the natural sky colors. We also used NIK Color Efex Pro with Detail Extractor at very low opacity and Pro Contract filters. We had to do a bit more clean up as there were some people around us and a small piece of cloud was distracting. Then we applied final selective sharpening.

WE DECIDED TO GO TO JOSHUA TREE NATIONAL PARK BECAUSE CAMILA IS A HUGE FAN OF THE BAND U2 AND JOSHUA TREE HAS A SPECIAL PLACE IN EACH U2 FAN'S HEART

Yaneck & Sasha are the founding partners of WASIO photography and WASIO faces. They've been serving Chicago & Midwest clients for over 10 years and recently expanded business to Southern California. WASIO has been selected as Top 3 Wedding Photographers in Chicago, Top 5 Wewdding Photographers in San Diego, and Top 5 Portrait Photographers in San Diego.

A wasiophotography.com

WATCH THE VIDEO

# Speedlights on Location

by Zach Gray

In this video we're out at the Red Rocks Amphitheatre in Colorado, with full day sun which was not the best time of day to shoot, causing us to look for areas with great shade. For my main lighting I'm using a speedlight with a Westcott Rapidbox and have a bare speedlight with a tungsten gel in the background that is two stops darker than the main light so that it's not overpoweringly bright.

I used this setup because the light is coming in but not in the direction we want it, the Rapidbox helps fill in that extra bit of light. This is a very simple setup, we're trying to recreate the beauty of the red rock and get beautiful light on the face.

# On Set with Rapper Camm

by Rob Christian Crosby

Rob Christian Crosby spends most of his time either taking photos or thinking about it. It started as an interest, but now Rob has found in it a profession.

robchristiancrosby.cominstagram.com/robcros

For this shoot, I used gels, mixing ambient light with strobes to create hiphop oriented portraits for hip-hop artist Camm's web content. The first shot you'll see is in-studio, I used a beauty dish that was above the subject with a blue gel. Then to the subject's right I used a strobe with a standard reflector with a red gel.

Shooting tethered was huge for this project in studio, and I when I started shooting tethered it immediately changed the way I shot. First, it allows me to see in detail what I was shooting. Second, it allowed me to make a preset, so I can see closer to how the photos will look in post.

I do a lot of different colored lighting setups with long exposures. The biggest challenge for me when shooting these type of photos is getting the right movement and exposure and color all in one photo.

When it came time for post-processing on this shoot I spent a lot of time color correcting on Capture One and also skin retouching on PhotoShop.

Before the shoot, I spent time in pre-production creating mood-board for this shoot. When it came to gear I used a Canon camera with a 24-70mm 2.8, 1 DigiBee Strobe, 1 AlienBee strobe, Mac-Book Pro and my Tether Tools TetherPro USB Cable.
